B5 Agenda and Notes from
Public Meetings May 1992
(Phase 2)

ROCKHAMPTON FLOOD MANAGEMENT STUDY

PUBLIC MEETINGS MAY 1992

AGENDA

- 1. Introduction and Summary of Phase 1 Report and Recommendations**
- 2. Discussion of Measures for Immediate Implementation**
 - Bruce Highway at Alligator Creek
 - Upgrading of flood warning system
 - Flood warning dissemination
 - Improving flood preparedness
 - Counter Disaster Planning and Operations
- 3. Discussion of Flood Mitigation Options Recommended for Consideration in Phase 2**
 - Yeppen Crossing
 - Levees
 - Flood Mapping/Planning Controls
- 4. Discussion of Discounted Flood Mitigation Options**
 - Flood Mitigation Storage
 - Major Diversions
 - River Channel Enlargements
- 5. Discussion of other Identified Issues**
 - Probable Maximum Flood
 - Scrubby Creek Diversion
 - Pilot Study re floodproofing commercial premises
 - Erosion/siltation in Lower Fitzroy River
 - Flood forecasting model
 - GIS for counter disaster planning
 - Leachate investigation
- 6. Any other Business**

ROCKHAMPTON FLOOD MANAGEMENT STUDY

PUBLIC CONSULTATION MAY 1992

Notes from Public Meeting

The Caves Hall 7.30 pm 5 May 1992

6 attendees (+ 5 apologies for absence)

2. Measures for Immediate Implementation

There was discussion regarding the adequacy of DOT proposals for the Alligator Creek crossing upgrade. Residents understood that the design would increase flood level in Alligator Creek by 0.1 m. DS stated he did not have full design information but understood this to be based on 50 year ARI flow in Alligator Creek, but unaware of tailwater conditions assumed. DS undertook to request details from DOT in regard to design assumptions, design criteria, bridge length, embankment height.

Proposals for flood warning upgrade, recorded message service, flood markers were well received. The following suggestions were made (Peter Baggett) in regard to giving a good service in this regard:

- recording service to include Tartrus, Riverslea, The Gap, Yaamba and Rockhampton to be useful to communities u/s of Rockhampton;
- the information should be run continuously, so that if missed first time round, a caller can wait and get a repeat;
- the information should be updated as frequently as necessary depending on conditions according to a classification system (eg. 3 levels of alert).

The central control of all river functions was raised - DS referred to discussion regarding better coordination of functions in the report. Peter Baggett suggested that each November 1st, that a stockpile of sand and sandbags be brought in to a central location - for subsequent flood use if necessary - if not required could be used up over remainder of year for other purposes.

3. Items for consideration in Phase 2

General discussion regarding Yeppen crossing and need to upgrade was expressed.

Levees were not discussed in detail as they did not affect Livingstone Shire residents directly.

The question of source material was raised, and one suggestion was made that material dredged from the river may be suitable. DS suggested this may be too low strength, but this would be looked into.

DS pointed out whilst flood maps would be prepared for urban area, this would not be possible for the rural area as there were no contour plans available on which to base maps. However, the hydraulic model would now be extended to Yaamba, enabling estimated flood levels for a range of flood magnitudes to be given.

4. Discounted Options

General agreement that these were not worth pursuing.

5. Other Issues

No points raised.

6. Other Business

Mr Baggett requested a longer period to read display material/report prior to meetings, and that the Executive Summary at least, be made more widely available.

Glenda Mather in summing up stated the necessity of taking a long term view in formulating proposals, as that part of what was now required was to put right past mistakes.

ROCKHAMPTON FLOOD MANAGEMENT STUDY

PUBLIC CONSULTATION MAY 1992

Notes from Public Meeting

Rockhampton City Hall 7.30 pm 6 May 1992

16 attendees

2. Discussion on Measures for Immediate Implementation

Bruce Highway upgrade at Alligator Creek supported.

Upgrading of flood warning system, flood markers, flood preparedness leaflets etc. well received. In response to a question that these would include the area upstream of the barrage, DS said they would. Regarding density of marking, DS suggested 4 per city block in urban area, probably less in rural residential areas.

Yeppen crossing - DS explained need to both increase bridge length and height and explained funding situation.

Mr Bailey suggested that costs may be reduced by using pipe-jacking or other techniques to increase waterway area to avoid need for total reconstruction.

3. Discussion on Flood Mitigation Options to be considered in detail in Phase 2

There was considerable discussion regarding levees-

landowners who may be affected were concerned re stock access and stock watering.

Resumption needs to be addressed, DS & Mr Carpenter agreed there was a possibility that easements would be used to reduce need for resumptions.

DS stressed that alignments not fixed - discussions will be held with those landowners who may be affected.

The problems of local drainage within levees was raised and it was agreed this could be a problem - siting levees away from developed areas to allow for some storage, and pumping if necessary were discussed.

The source of levee material was raised - DS stated this is part of Phase 2 studies.

Comments were made in regard to high velocity of flow in Port Curtis area d/s of Yeppen bridge, so levee in this area would need considerable protection.

The same connect applies along the river - DS said that retaining wall may be required as part of system along river bank when space was limited and/or velocities high.

The necessity to ramp both the highway and railway over levee near Jellicoe Street

was discussed and it was agreed that this would be required.

The need for a flood gate on the main drain and flap valves on storm water outfalls was discussed.

Ms Dawson raised the possibility of using prisoners for levee construction as a means of reducing costs. DS said cost estimates would be based on typical contract rates, but this possibility could be explored by the community at the appropriate time.

The effect of the levees on flow distribution, flood levels and velocities was discussed by a number of persons. DS stated that this was one of the major parts of the Phase 2 study, and these effects would be studied in detail by using the hydraulic model currently being set up. The question of the High Bank (Pink Lily) was raised - DS stated that stabilisation was recommended, model would be used to set control level.

The effect of increasing the height of the levees and the airport would also be studied, as would the effect of the proposed runway extension. The rebuilding of levees to their pre-flood condition was raised and Mr Carpenter pointed out that this was done using National Disaster Relief Funds which are not available for any purpose other than for reinstatement of damaged works.

The positive effect of levee protection in raising property values was discussed, as was the possibility of re-zoning and relocation of planning controls behind the levee. DS pointed out that residents protected by a levee need to be aware of the levee of protection afforded and not lulled into a false sense of security.

The need for upgrading Yeppen Crossing to reduce indirect losses was stressed by a number of persons, and it was pointed out that business losses were, in part, passed on to individuals in loss of earnings etc. This was seen as the top priority by at least some of the attendees.

In discussing the Yeppen Crossing, it was asked whose responsibility it was. DS stated that he believed DOT to be the responsible authority.

The flood mapping proposal was explained and did not receive any adverse comment.

4. Discounted Flood Mitigation Options

Mr Bailey disagreed with the discounting of the major Pink Lily - Yeppen - Midgee floodway. DS outlined large size of channel which would be required. Mr Bailey was invited to submit his proposals to DS who undertook to further look into this.

No reaction to other discounted options.

5. Other Identified Issues

There was some discussion regarding Scrubby Creek - DS pointed out that the Phase 1 report makes a number of suggestions in this regard, but cannot be done within current study.

6. Other Business

Ms Dawson asked if it would be possible to get input from the public, say a few nominated persons, when results of model studies are known. DS stated that this had been suggested to the Steering Committee early in Phase 1 but had not been taken up. DS suggested Ms Dawson write to Mr McKenna as Chairman of the Steering Committee in this regard.

DS outlined timetable for remainder of study – there would be a further round of public meetings once Phase 2 had been completed – prior to completion of the final report.

In response to a question, DS outlined the possibility for funding under FWRAP; the likely lead time; the need to compete with other Federal State priorities; and that the initiation of any such application for funding would have to come from Council.

Mr Carpenter was asked for feedback on Council's response. Mr Carpenter replied that Council was awaiting the Final Report before proceeding.

ROCKHAMPTON FLOOD MANAGEMENT STUDY

PUBLIC CONSULTATION MAY 1992

Notes from Public Meeting

Gracemere Community Centre 7.30 pm 7 May 1992

31 attendees

2. Discussion on Measures for Immediate Implementation

Mr Besch asked for flood warning station at Yaamba to be upgraded to telephone telemetry and incorporated into recorded message system.

3. Flood Mitigation Options to be considered in detail in Phase 2

A request was made to include consideration of the impact of the Capricorn Highway on flood levels as well as Yeppen Crossing. DS agreed that model studies would look at this. A number of points were raised in regard to the Capricorn Highway.

- it was pointed out that closure of the Capricorn Highway between Gracemere and the Bruce Highway was not so critical as the Bruce Highway Crossing as there is an alternative access route;
- the question was raised that if the Capricorn Highway was designed as a low level crossing subject to flooding, why is it raised above the surrounding ground level. Several speakers suggested that either adequate cross drainage (culvert) capacity be installed, or the road be lowered;
- several speakers believed that this section of the Capricorn Highway caused flood levels to increase on the upstream side;
- one speaker noted that the Capricorn Highway may be widened to 4 lane and that the existing road reserve accommodates this.

In regard to Yeppen Crossing, there appeared to be a general view that increasing bridge length to lessen the impact on flood levels would be beneficial. DS explained that if this is recommended, it will require a combination of additional waterway area and increased road height, and that hydraulic model studies will determine the requirements.

Following a discussion of costs and possible funding for the above, Bill Johnson asked whether it was possible that the Department of Defence would contribute to funding. DS said he would follow this up.

There was a general discussion regarding the possible levees around Port Curtis, Depot Hill etc. Some speakers questioned the cost effectiveness of this. Others were concerned that this would further worsen flood levels in the Fairybower/Gracemere area. DS said that this was one of the things to be investigated using the hydraulic model.

Steve Merchin pointed out that Fairybower/Gracemere residents had been disadvantaged, in terms of impact on flood levels by previous developments eg. barrage, Bruce Highway/Capricorn Highway and would not support any scheme which further worsened their situation and would not wish to have to contribute to the cost of any such scheme. On a show of hands, this view was unanimous.

One speaker commented that he understood that land values in Depot Hill had increased since the 1991 flood whereas those in the floodplain has decreased.

A similar discussion was held in regard to the airport levee. DS stated that hydraulic model studies would investigate the impact of levees around the existing airport and also the proposed runway extension.

Concern was expressed in regard to the effect of increased levee height on flow distribution in the floodway, in particular in regard to the Nine Mile Road area.

One speaker suggested that the airport be relocated out of the floodplain. DS stated that this issue was outside the scope of the present study.

In summary on the issue of the various levee proposals, Gracemere area residents would not support any such schemes which would cause further detriment to themselves.

4. Discounted Flood Mitigation Options

There was general agreement that it was correct not to consider these schemes further.

5. Other Identified Issues

PMF - DS explained why it was decided not to do formal PMF estimation as part of the study.

Scrubby Creek - DS advised that report contains a number of recommendations/suggestions but that further work is required. Mr Clewley (WRC) stated that agreement between WRC and RCC regarding responsibility was nearing conclusion. As there is strong local feeling regarding this issue, DS suggested that community pressure be brought to bear in regard to further studies required.

6. Other Business

Bill Johnson, in summing up his view of the report and meeting said:

- there is a general consensus of opinion from those attending the meeting that the proposals (levees) will have an adverse impact on people in the Fairybower area;
- he regarded the Phase 1 report as unsatisfactory in that it did not mention problems caused by the Capricorn Highway, that Scrubby Creek was not going to be further investigated, and that there was insufficient emphasis regarding the Fairybower/Gracemere area. On a show of hands 4 persons agreed with this view.

FLOOD LIABLE LAND DEVELOPMENT GUIDELINES

Reproduced from the NSW Government Floodplain
Development Manual (1986)

4.5.3 Development Guidelines

The following tables present guidelines to assist councils in the formulation of floodplain management plans, drafting of development conditions and in assessing the suitability of various types of developments with regard to prevailing flood hazard etc. There are six tables, one for each combination of hydraulic and hazard category (refer Figure 5).

FIGURE 5 Index to Development Guidelines

hazard category	hydraulic category		
	flood fringe	flood storage	floodway
low hazard	TABLE 1 low hazard flood fringe	TABLE 2 low hazard flood storage	TABLE 3 low hazard floodway
high hazard	TABLE 4 high hazard flood fringe	TABLE 5 high hazard flood storage	TABLE 6 high hazard floodway

NOTE: table numbers refer to the appropriate guideline tables

TABLE 1 Development Guidelines
Low Hazard — Flood Fringe

		development categories				
		infill development	new development	redevelopment	major additions	minor development and minor additions
land use categories	residential					
	commercial					
	industrial					
	open space					considerations: 1, 2 and 3
	rural/ non-urban					considerations: 1 and 4a
	special use					
where necessary this form of development should be sited on flood free land; on flood liable land, considerations: 1 and 2				considerations: 1 and 2		

nature of flooding

- Water depths are less than 0.8m.
 - Should it be necessary, people and their possessions can be evacuated by trucks.
 - Able-bodied adults would have little difficulty in wading.
 - Damage potential would be low

implications of flooding

- Developments will not have a significant effect on the depth and speed or distribution of floodwaters.
 - Most developments are suitable, except for some special use developments which by their nature are sensitive to flooding or where the use is especially necessary in times of flooding
 - It will not be necessary to check the effect of proposed development on flood behaviour.

development considerations

- SPECIAL**

 1. Any portion of a building or structure subject to inundation should be built from flood compatible materials.
 2. Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.

The need to flood-proof commercial and industrial development should be determined on merit.
 3. Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
 4. (a) The Flood Policy exempts minor development and

The need to flood-proof commercial and industrial development should be determined on merit.

3. Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
 4. (a) The Flood Policy exempts minor development and additions from special controls.
 - (b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.

TABLE 2 Development Guidelines
Low Hazard — Flood Storage

	development categories			
	infill development	new development	redevelopment	major additions
land use categories	residential			considerations: 1 and 2
	commercial			considerations: 1, 2 and 3
	industrial			considerations: 1 and 4a
	open space			considerations: 1, 2, 3 and SPECIAL where warranted
	rural/ non-urban			
	special use			where necessary this form of development should be sited on flood free land; on flood liable land, considerations: 1, 2 and SPECIAL

nature of flooding

- Water depths are less than 0.8m.
- Should it be necessary, people and their possessions can be evacuated by trucks.
- Able-bodied adults would have little difficulty in wading.
- Damage potential would be low.

implications of flooding

- The impact of new development on flood storage and therefore flood behaviour needs to be addressed.
- Most developments are compatible, except for some special use developments which by their nature are sensitive to flooding or where the use is especially necessary in times of flooding.

development considerations

1. Any portion of a building or structure subject to inundation should be built from flood compatible materials.
 2. Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.
The need to flood-proof commercial and industrial development should be determined on merit.
 3. Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
 4. (a) The Flood Policy exempts minor development and additions from special controls.
(b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.
- SPECIAL**
- If a new development in a Flood Storage area is likely to cause a significant reduction in storage capacity, the developer or property owner should be required to demonstrate to the consent authority that the proposal will not significantly increase flood levels. If the development would cause a significant increase in flood levels, the developer or property owner should provide adequate and acceptable compensating works to offset the increase. A detailed report by an appropriate consulting engineer should be required in support of a development or building application.

TABLE 3 Development Guidelines
Low Hazard — Floodway

land use categories	development categories				minor development and minor additions
	infill development	new development	redevelopment	major additions

commercial					
industrial					
open space					
rural/ non-urban					
special use					

considerations: 1, 2, 3, 5 and SPECIAL

considerations: 1, 2, 3, 5 and SPECIAL where warranted

*where necessary this form of development should be sited on flood free land;
on flood liable land, considerations: 1, 2, 5 and SPECIAL*

nature of flooding

- Water depths are less than 0.8m.
- Should it be necessary, people and their possessions can be evacuated by trucks.
- Able-bodied adults would have little difficulty in wading.
- Damage potential would be low.

implications of flooding

- The impact of development on the floodway and therefore flood behaviour needs to be addressed.
- In order to reduce the hazard to existing development, a floodplain management study might be needed to identify appropriate management measures.

development considerations

1. Any portion of a building or structure subject to inundation should be built from flood compatible materials.
2. Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.

The need to flood-proof commercial and industrial development should be determined on merit.
3. Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
4. (a) The Flood Policy exempts minor development and additions from special controls.

(b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.
5. The developer or property owner should demonstrate that any building or structure can withstand the force of flowing floodwaters, including debris and buoyancy forces as appropriate. A detailed report from an appropriate consulting structural engineer should be required in support of a development or building application.

SPECIAL

- In floodway areas, the property owner or developer should be required to satisfactorily demonstrate to the consent authority that the development will not increase the flood hazard or flood damage to other properties or adversely affect flood behaviour. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.

TABLE 4
**Development Guidelines
High Hazard — Flood Fringe**

land use categories	development categories				
	infill development	new development	redevelopment	major additions	minor development and minor additions
residential		considerations: 1, 2, 3, 5 and SPECIAL		considerations: 1, 2 and 5	
commercial		considerations: 1, 2, 3, 5 and SPECIAL		considerations: 1, 2, 3 and 5	considerations: 1 and 4a
industrial					
open space		considerations: 1, 2, 3 and 5			
rural/ non-urban					
special use		where necessary this form of development should be sited on flood free land; on flood liable land, considerations: 1, 2, 5 and SPECIAL			

nature of flooding

- Floodwaters are generally over 1m deep and slowly moving.
- Evacuation routes can be cut early in the flood.
- Many buildings can be inundated.
- Evacuation of people and possessions may be difficult and may need to be by boat or helicopter, often at some risk to the operators.
- Social disruption and financial loss could be high.
- There may be danger to life and limb.

implications of flooding

- Developments will not have a significant effect on the depth and speed or distribution of floodwaters.
- It will not be necessary to check the effect of proposed developments on flood behaviour.
- In order to reduce the hazard to existing development, a floodplain management study should be undertaken to identify the appropriate measures.
- Whilst new development is not generally considered appropriate in a high hazard area, it may be acceptable under special conditions. Such conditions should involve a detailed review of the potential flood hazard to the development itself.

development considerations

- Any portion of a building or structure subject to inundation should be built from flood-compatible materials.
- Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.
The need to flood-proof commercial and industrial development should be determined on merit.
- Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
- (a) The Flood Policy exempts minor development and additions from special controls.
(b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.
- The developer or property owner should demonstrate that any building or structure can withstand the force of flowing floodwaters, including debris and buoyancy forces as appropriate. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.

SPECIAL

- In high hazard areas, the developer or property owner should be required to satisfactorily demonstrate to the consent authority that permanent, fail-safe, maintenance-free measures are incorporated in the development, to ensure the timely, orderly and safe evacuation of people from that area, should a flood occur. In addition, it should also be demonstrated to the consent authority, that the displacement of these people will not significantly add to the overall cost and community disruption caused by the flood. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.

TABLE 5

Development Guidelines High Hazard — Flood Storage

land use categories	development categories				
	infill development	new development	redevelopment	major additions	minor development and minor additions
residential					
commercial					
industrial					
open space					
rural/ non-urban					
special use					

considerations: 1, 2, 3, 5 and SPECIAL

considerations: 1, 2, 3, 5 and SPECIAL

considerations: 1, 2, 3 and 5

consideration: 4a

**where necessary this form of development should be sited on flood free land;
on flood liable land, considerations: 1, 2, 5 and SPECIAL**

nature of flooding

- The depth of floodwaters can be 1m or more.
- The speed of floodwaters is slow, and in effect the floodwaters form a pond.
- Many single storey buildings could be completely inundated and may suffer structural problems due to buoyancy.
- Evacuation of people and possessions may be difficult and may need to be by boat or helicopter, often at some risk to the operators.
- There may be danger to life and limb.
- Social disruption and financial loss could be high.

implications of flooding

- In order to reduce the hazard to existing development, a floodplain management study should be undertaken to identify the appropriate measures.
- The impact of new development on flood storage and therefore on flood behaviour needs to be addressed.
- Whilst new development is not generally considered appropriate in a high hazard area, it may be acceptable under special conditions. Such conditions should involve a detailed review of the impact of the development on flooding and of the potential hazard to the development itself.

development considerations

- Any portion of a building or structure subject to inundation should be built from flood-compatible materials.
 - Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.
 - The need to flood-proof commercial and industrial development should be determined on merit.
 - Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
 - (a) The Flood Policy exempts minor development and additions from special controls.
 - (b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.
 - The developer or property owner should demonstrate that any building or structure can withstand the force of flowing floodwaters, including debris and buoyancy forces as appropriate. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.
- SPECIAL**
- In high hazard areas, the developer or property owner should be required to satisfactorily demonstrate to the consent authority that permanent, fail-safe, maintenance-free measures are incorporated in the development, to ensure the timely, orderly and safe evacuation of people from that area, should a flood occur. In addition, it should also be demonstrated to the consent authority, that the displacement of these people will not significantly add to the overall cost and community disruption caused by the flood. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.
 - If a new development in a Flood Storage area is likely to cause a significant reduction in storage capacity, the developer or property owner should be required to demonstrate to the consent authority that the proposal will not significantly increase flood levels. If the development would cause a significant increase in flood levels the developer or property owners should provide adequate and acceptable compensating

works to offset the increase. A detailed report by an appropriate consulting engineer should be required in support of a development or building application.

TABLE 6

Development Guidelines
High Hazard — Floodway

land use categories	development categories				
	infill development	new development	redevelopment	major additions	minor development and minor additions
residential					
commercial					considerations: 1, 4a and 4b
industrial					
open space					considerations: 1, 2, 3, 5 and SPECIAL where warranted
rural/ non-urban					
special use					where necessary this form of development should be sited on flood free land; on flood liable land, considerations: 1, 2, 5 and SPECIAL

nature of flooding

- The depth and speed of floodwaters are such that buildings could sustain major structural damage and in extreme cases, light framed houses could be washed away.
- There could be major difficulties and dangers in evacuating people and their possessions.
- There may be danger to life and limb.
- Social disruption and financial loss could be very high.

implications of flooding

- The impact of development on the floodway and therefore on flood behaviour needs to be addressed.
- In order to reduce the hazard to existing development, a floodplain management study should be undertaken to identify the appropriate measures.
- Whilst new development is not generally considered appropriate in a high hazard floodway area, it may be acceptable under special conditions. Such conditions should involve a detailed review of the impact of new development on flooding and of the potential hazard to new or existing development.

development considerations

- Any portion of a building or structure subject to inundation should be built from flood-compatible materials.
 - Flood proofing to 0.5m above the standard flood should be required of habitable floors of new residences, including those associated with commercial and industrial development, and of normally occupied floors of special use developments. Whilst this condition would generally apply to major residential extensions, the merits of the case should determine the need.

The need to flood-proof commercial and industrial development should be determined on merit.
 - Special consideration should be given to caravan parks as they are difficult to evacuate, a fact which can be compounded by permanent vans and visitors lacking flood awareness. Also, caravans are easily damaged and can float.
 - (a) The Flood Policy exempts minor development and additions from special controls.

(b) The potential for damage to development or adverse impacts on flood behaviour may need to be considered in specific cases, which should be treated on their merits.
 - The developer or property owner should demonstrate that any building or structure can withstand the force of flowing floodwaters, including debris and buoyancy forces as appropriate. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.
- SPECIAL**
- In high hazard areas, the developer or property owner should be required to satisfactorily demonstrate to the consent authority that permanent, fail-safe, maintenance-free measures are incorporated in the development, to ensure the timely, orderly and safe evacuation of people from that area, should a flood occur. In addition, it should also be demonstrated to the consent authority, that the displacement of these people will not significantly add to the overall cost and community disruption caused by the flood. A detailed report from an appropriate consulting engineer should be required in support of a development or building application.
 - In floodway areas, the property owner or developer should be required to satisfactorily demonstrate to the consent authority that the development will not increase the flood hazard or flood damage to other properties or adversely affect flood behaviour. A detailed report by an appropriate consulting engineer should be required in support of a development or building application.

APPENDIX L
DEPARTMENT OF TRANSPORT PERSPECTIVE

ROCKHAMPTON FLOOD MANAGEMENT STUDY RECOMMENDATIONS
DEPARTMENT OF TRANSPORT PERSPECTIVE

The Bruce Highway is a National Highway and its construction and maintenance are funded by the Federal Government which also sets standards and approves improvement strategies for such work.

Upgrading needs are determined in accordance with Road Network Strategies which evaluate the condition of the road and its likely future condition against defined standards. These standards include width/traffic volume, pavement condition (strength and roughness), accident history, flood immunity and other factors such as alignment, intersection capacity and bridge strength.

In determining priority for works, the condition deficiencies are evaluated and cost-effective remedial options determined taking into account whole of life costs. Benefit/cost ratios are calculated which take account of vehicle operating and travel time savings, accident reduction, as well as economic and regional development benefits. The benefits of flood immunity improvements are included.

Within available funds, projects on the current National Highway program in Queensland have an average BCR of 2.5. The Bruce Highway component of the National Highway Planning Program gives BCR > 4.5 for major works. Projects with width deficiencies such as the Cooroy bypass and the southern approaches to Cairns have BCR of 3 - 4.

Following the 1991 floods, the problems and upgrading options at Alligator Creek near Yaamba were re-evaluated. The analysis indicated that this had the highest priority for upgrading on a flood immunity basis over the whole National Highway system in Queensland including the Landsborough and Barkly Highways. Its BCR is 4.8 at 7% discount rate.

The project was approved for construction by the Federal Government and work has commenced on the first stage which involves high level bridges over Alligator and Plentiful Creeks on a deviation of the highway adjacent to the North Coast rail line. The second stage involves raising the road at Smith's Gully north of Yaamba. The whole project is estimated to cost \$9.6m and will be completed in late 1993.

At the completion of this work, Rockhampton will no longer be isolated to the north as a result of flooding in the Fitzroy River or in Alligator Creek.

Because of the relatively shorter times of submergence and the higher costs of remedial work, the same priority is not indicated for the Yeppen flood plain. The results of the Rockhampton Flood Management Study show a BCR of 1.1 at 7% discount rate. It is noted that this analysis has included benefits accruing to local business where this information is not normally available to the Department of Transport. Hence the BCR of 1.1, while relatively high in terms of the current study, is inflated when considered in terms of normal Department of Transport analysis.

In summary, from the "Department of Transport Perspective", and where the Federal Government is the funding authority for National Highway projects, the flood immunity works for the Yeppen Flood Plain are of low BCR value and need to compete with other projects with much higher BCRs for priority and funding considerations. It is on this basis that the Yeppen Flood Plain is assessed as being of relatively low priority and behind other projects in terms of width, travel and operating costs, safety, strength and roughness deficiencies.

At present, there are no plans to upgrade the Yeppen Flood Plain from road funding sources at likely future funding levels.

However if funds are available for the Yeppen project through other programs directed toward mitigation of flood effects then obviously there would be no objection from the Department of Transport to accelerating construction of the necessary remedial works.
